QED Clarion 8 MPS Strategy

MAY 2022

QED FINANCIAL ASSOCIATES
INDEPENDENT FINANCIAL ADVISERS

STRATEGY OBJECTIVE

The QED Clarion 8 MPS Strategy is matched to a risk profile (level 8) which targets a specific range of volatility. QED use a 1 to 10 rating system with 1 being low risk and 10 high risk.

The QED Clarion 8 MPS Strategy will typically invest around 65% to 90% in domestic and / or international equity funds, while also providing some exposure to fixed interest funds, cash and / or money market funds. Equity exposure will provide the opportunity for capital and dividend income to grow over time. Fixed interest investments will help to provide some stability of capital and a regular level of income. There may also be exposure to exchange-traded products (ETPs) and funds investing into "alternatives" such as commercial property, private equity, commodities and absolute return strategies. A minimum of 20% of the Strategy will typically be allocated to index-tracking investments.

STRATEGY PERFORMANCE

Powered by data from FE

Source: Quilter Cheviot, FE fundinfo. Model Performance is shown in GBP, gross of management fees but net of underlying fund costs, with all income reinvested, actual returns may vary.

Past performance is not a reliable indicator of future performance. The value of investments and the income from them can go down as well as up. You may not recover what you invest.

CHARGES INFORMATION

Annual Management Charge:	0.18%
Weighted Cost of Underlying Collective Funds*	0.60%

Costs and charges data for the underlying funds held within the MPS Strategies is sourced from Morningstar. Where costs and charges data for a fund is not available from Morningstar, Quilter Cheviot will use alternate data sources or reasonable endeavours to estimate this figure.

*This represents the estimated cost of additional charges paid to external third party collective fund managers. This will include the OCF and Transactional Charges.

KEY FACTS

Historic Yield	1.42%

MARKET COMMENTARY

Global stock markets came back under pressure in April as concerns surrounding monetary policy tightening soured investor sentiment. Inflation data hit new cycle highs in the US, UK and Europe, pushing interest rates up further on expectations central banks will remain vigilant in their quest to curb rising prices.

Overall, it was another challenging month for markets with the World MSCI Index falling 8%, in US dollar terms. Rising yields weighed on growth stocks in particular, with the Nasdaq falling around 13% for its worst monthly decline since the 2008 financial crisis. These declines were cushioned to some extent for sterling-based investors due to a sizable drop in the GBP/USD rate, which fell to its lowest level since the summer of 2020 to trade in the mid-1.20s. In sterling terms, the drop in global equities was roughly 4%.

Despite the Bank of England beginning to hike rates before their US counterparts, it is now viewed as adopting a relatively less hawkish path going forward. As well as contributing to sterling's depreciation, the effects of this policy divergence can also be felt in the stock market. UK large cap stocks fared relatively well, ending the month with a small gain, thanks in part to a significant weighting towards energy stocks. However, mid- and small-cap shares fell in the UK.

Rising rates can be seen across the fixed income universe as bond prices fell on the expectation of imminent aggressive central bank tightening. Both the short- and long-end of the curve rallied with the US 10-year moving above the 3% handle to hit its highest level in more than three years. This has led to rising mortgage rates, with a US 30-year mortgage now around 5%. UK Gilts fared slightly better than sterling corporates, though both experienced notable declines. Inflation-linked bonds fell further still, along with emerging market bond indices.

IMPORTANT INFORMATION EXPLAINED

STRATEGY PERFORMANCE

Market and economic conditions will change over time and these and other future developments will impact the future risks and returns of asset classes.

HISTORIC YIELD

The level of yield actually achieved on your portfolio will be dependent on the tax treatment of the product you have invested in and your personal tax circumstances. The historic yield data is calculated using the previous year's dividend information and the bid or mid price from the last dividend. Estimated gross yield is not a reliable indicator of future returns.

ANNUALISED VOLATILITY AND DRAWDOWN

Volatility is a measure of risk and measures the variability of price fluctuations of an investment, or a portfolio of investments. Realised (i.e. experienced) model volatility is expressed as the annualised standard deviation of returns over the stated time period(s), calculated using monthly data. The realised drawdown is the peak to trough decline experienced by the model over the stated time period(s), calculated using monthly data. Estimated annualised volatility and drawdown figures have been calculated based upon an historic analysis of the model's current strategic asset allocation, calculated using monthly data.

EXCHANGE RATE RISK

Changes in exchange rates may have an adverse effect on the value, price or income of foreign currency denominated securities.

ASSET ALLOCATION

Clients investing in the strategy for the first time, either via new business or a switch, will have their portfolio determined by the fund and asset allocations set at the last rebalance date (as detailed on Page 1 of this document for the Asset Allocation). The asset allocation is shown at a point in time reflecting the last rebalance date. Due to market movements there will be a difference in the asset allocation of *existing* clients' portfolios as at the date of the factsheet.
